

HCL AppScan Report

Report Type: Security Report

Scan Name: Supply Chain Rapid Diagnostics Factory_2026-05-19_08-15-29

Technology: SAST

Application Name: Smart Tools

Business Impact: Unspecified

Report created at: Tuesday, May 19, 2026

This report was generated by HCL AppScan

Summary of security issues

High severity issues: 56

Medium severity issues: 544

Total security issues: 600

Scan Information

Scan started: Tuesday, May 19, 2026 8:16:14 AM (UTC)

Table of Contents

Summary

- Issues

Fix-Groups

- Common API Call: [Authentication.Credentials.Unprotected](#): Secrets: Hardcoded credentials detected
- Common API Call: [Authentication.Credentials.Unprotected](#): Secrets: Potential Azure Active Directory Authentication Secrets Detected
- Common API Call: [Configuration](#): Insecure use of base image version detected in Dockerfile
- Common API Call: [Cross-Site Scripting](#): Use of dangerouslySetInnerHTML attribute in ReactJS
- Common API Call: [Reflected Cross Site Scripting](#): Insecure Use of Window Open
- Common API Call: [Reflected Cross Site Scripting](#): JQuery HTML Function Use
- Common API Call: [Cryptography.InsecureAlgorithm](#): Python insecure cryptography algorithm
- Common API Call: [ErrorHandling](#): Raising generic exceptions in Python
- Common API Call: [Improper Handling of Exceptional Conditions](#): Exposure of confidential information through console or logging methods in JavaScript
- Common API Call: [Improper Handling of Exceptional Conditions](#): Exposure of confidential information through print or logging methods in python code
- Common API Call: [Improper Handling of Exceptional Conditions](#): Exposure of confidential information through print or logging methods in Python code
- Common API Call: [Injection](#): Exec code injection
- Common API Call: [Injection](#): Exec code injection
- Common API Call: [PathTraversal](#): Join and relpath path traversal
- Common API Call: [PathTraversal](#): Join and relpath path traversal
- Common API Call: [PrivilegeEscalation](#): No non-root USER specified in Dockerfile configuration

How to Fix

- [Authentication.Credentials.Unprotected](#) - Secrets: Hardcoded credentials detected
- [Authentication.Credentials.Unprotected](#) - Secrets: Potential Azure Active Directory Authentication Secrets Detected
- [Configuration](#) - Insecure use of base image version detected in Dockerfile
- [Cross-Site Scripting](#) - Use of dangerouslySetInnerHTML attribute in ReactJS
- [Cryptography.InsecureAlgorithm](#) - Python insecure cryptography algorithm
- [ErrorHandling](#) - Raising generic exceptions in Python
- [Improper Handling of Exceptional Conditions](#) - Exposure of confidential information through print or logging methods in python code
- [Improper Handling of Exceptional Conditions](#) - Exposure of confidential information through print or logging methods in Python code
- [Improper Handling of Exceptional Conditions](#) - Exposure of confidential information through console or logging methods in JavaScript
- [Injection](#) - Exec code injection
- [PathTraversal](#) - Join and relpath path traversal
- [PrivilegeEscalation](#) - No non-root USER specified in Dockerfile configuration
- [Reflected Cross Site Scripting](#) - JQuery HTML Function Use
- [Reflected Cross Site Scripting](#) - Insecure Use of Window Open

Summary

Total security issues: **600**

Issue Types: **10**

		Number of Issues
Authentication.Credentials.Unprotected	17	
Cryptography.InsecureAlgorithm	30	
PrivilegeEscalation	1	
Reflected Cross Site Scripting	8	
Configuration	1	
Cross-Site Scripting	2	
ErrorHandling	5	
Improper Handling of Exceptional Conditions	118	
Injection	3	
PathTraversal	415

How to Fix

H Authentication.Credentials.Unprotected - Secrets: Hardcoded credentials detected

Cause

Hardcoded credentials, such as usernames, passwords, and API Keys are a common security vulnerability. When credentials are hardcoded into an application's source code, they can be exposed to anyone who has access to the code, leading to unauthorized access and data breaches.

Hardcoded credentials pose several risks:

Exposure of sensitive information: If the source code is exposed, either through a repository leak or a simple oversight, anyone can see and use these credentials.

Lack of flexibility: Hardcoded credentials can't be changed without modifying the source code. This makes it difficult to rotate, revoke, or update credentials.

Non-compliance: Many industry regulations and standards require proper management of sensitive information, including credentials.

Fix recommendation

Instead of hardcoding credentials in the source code, consider these alternatives:

Environment variables

Environment variables are a secure way to store sensitive information. They are set in the environment in which the application runs and can be accessed programmatically.

User input

For applications that interact with users, consider prompting for credentials at runtime.

Secure credential storage

Use secure storage solutions like AWS Secrets Manager, Azure Key Vault, or HashiCorp Vault. These tools store credentials securely and provide them to your application as needed.

Configuration files

Store credentials in a configuration file that is not included in the source code repository. Make sure this file is encrypted and protected with appropriate file system permissions.

- [Use of hard-coded password](#)

[Go to Table of Contents](#)

H Authentication.Credentials.Unprotected - Secrets: Potential Azure Active Directory Authentication Secrets Detected

Cause

The Azure Client ID and Azure Tenant ID are identifiers for the application and the Azure Active Directory (Azure AD) tenant, respectively. They can provide some information about the application and tenant, which could potentially be used in social engineering or other types of attacks.

The Azure Client Secret is a confidential value that is generated when the application is registered in Azure AD. It is used to authenticate the application with Azure AD and should not be shared or transmitted over the network. Only the application and the Azure AD tenant should have knowledge of the client secret. If the client secret is compromised, an

attacker could use it to access the organization's resources.

Fix recommendation

Securely store the client secret using Azure Key Vault or a similar solution.

Rely on Azure AD validation during application registration to ensure the client secret meets security requirements.

- [Recommendations for protecting application secrets](#)
- [Best practices for secrets management in Key Vault](#)

[Go to Table of Contents](#)

M Configuration - Insecure use of base image version detected in Dockerfile

Cause

Using non-specific versions for base images in Dockerfiles leads to security vulnerabilities by allowing the use of insecure or unstable images. This compromises the security and stability of the container and the host system.

Fix recommendation

Use three-level versioning (major.minor.patch) or SHA256 digests for base images in Dockerfiles.

Avoid using non-specific versions (such latest, alpine, slim, or buster) without specifying a fixed version, as well as single-point (such as, 14), two-point (such as, 14.17), or no versions specified.

M Cross-Site Scripting - Use of dangerouslySetInnerHTML attribute in ReactJS

Cause

The detected ReactJS code has dangerouslySetInnerHTML attribute set. The use of the feature is a bad practice, especially when dealing with user inputs and dynamic data.

```
<div
  dangerouslySetInnerHTML={ {
    __html: ''
  } }
/>
```

Fix recommendation

Avoid using dangerouslySetInnerHTML whenever possible. When it's required, always sanitize the data before setting it to the attribute.

External references

- [dangerouslySetInnerHTML](#)
- [Cross-site Scripting \(XSS\)](#)
- [OWASP XSS Cheat Sheet](#)

H Cryptography.InsecureAlgorithm - Python insecure cryptography algorithm

Cause

Using insecure cryptographic algorithms to hash passwords can be dangerous and exploitable. Algorithms such as MD2, MD3, MD4, MD5, SHA, SHA1_CRYPT, MD5_CRYPT are broken. They can be used for hashing files only; they should not be used for password or any important credentials.

```
hashlib.md5().update(salt + password)
md5_hash = hashlib.new('md5')
hash = MD2.new()
md5_hash = hashlib.new('md5')
hashlib.md5(b"text").hexdigest()
hashlib.md5().update(salt + pw)
hashlib.md5().update(salt + password)
```

Fix recommendation

Identify whether a hash is used for a password (check for permutations of password) or string and use SHA256 or a higher algorithm. If file/certificate/open file is used as parameter, then it is okay to use an insecure algorithm for hashing it. If keywords like hashlib, update, verify, encrypt, or hash come up, check the algorithm it is one of the flagged ones.

```
print(hashlib.sha1(open('bad.crypto.py', 'rb').read()).hexdigest())
password = sha256_crypt.encrypt("password")
```

M ErrorHandling - Raising generic exceptions in Python

Cause

Raising Exception or BaseException obscures the underlying issue, prevents precise error handling, and may inadvertently catch exceptions intended for system exit or interruption. Specific exceptions (for example, ValueError, ConnectionError, RuntimeError subclasses) enable targeted handling. Generic raises make debugging and recovery logic less effective.

Fix recommendation

Raise exceptions that reflect the error category (validation, I/O, state, protocol).

Avoid BaseException; it includes SystemExit and KeyboardInterrupt in the hierarchy.

Include actionable messages and chain exceptions with 'from' when re-raising.

- [CWE-397: Declaration of Throws for Generic Exceptions](#)
- [Python Standard Exceptions Documentation](#)

[Go to Table of Contents](#)

M Improper Handling of Exceptional Conditions - Exposure of confidential information through print or logging methods in python code

Cause

An attacker can cause errors to occur by submitting unusual requests to the web application. The response to these errors can reveal detailed system information, deny service, cause security mechanisms to fail, or crash the server. An attacker can use error messages that reveal technologies, operating systems, and product versions to tune the attack against known vulnerabilities in these technologies.

The application uses diagnostic methods that provide significant implementation details such as stack traces as part of its error handling mechanism.

Production applications should never use methods that generate internal details such as stack traces and error messages unless that information is directly committed to a log that is not viewable by the end user. All error message text should be HTML entity encoded before being written to the log file to protect against potential cross-site scripting attacks against the viewer of the logs.

Fix recommendation

Rather than providing full details including stack traces to the user of your application, log the full details privately, and display a generic message to the user. The following example shows a caught exception being logged to a log file and a simple error message displayed to the user.

```
try
{
    //something here
} catch (Exception e) {
    // full details in log file
    Utils.logExceptions("Some note here", e);

    // rethrow with generic message
    throw new Exception("Generic user message");
}
```

CWE

497

M Improper Handling of Exceptional Conditions - Exposure of confidential information through print or logging methods in Python code

Cause

Logging or printing sensitive information such as passwords, tokens, API keys, credit card numbers, or other confidential data can lead to information disclosure vulnerabilities. If this sensitive information is exposed in logs, console output, or error messages, it can be accessed by unauthorized parties, leading to security breaches and privacy violations.

Fix recommendation

Never log or print sensitive information such as passwords, tokens, API keys, credit card numbers, SSNs, or other confidential data in plain text.

Use masking or sanitization functions to redact sensitive data before logging or printing.

Implement proper logging practices with different log levels and ensure sensitive data is not included in debug or info level logs.

Review and audit logging statements regularly to ensure no sensitive information is being exposed.

Consider using structured logging with filters to automatically redact sensitive fields.

- [CWE-215: Insertion of Sensitive Information Into Debugging Code](#)

M Improper Handling of Exceptional Conditions - Exposure of confidential information through console or logging methods in JavaScript

Cause

Sensitive information such as passwords, tokens, API keys, credentials, authentication data, credit card numbers, SSNs, or private keys should never be output through console methods or logger calls. Exposing such data in logs or console output often occurs due to debugging, troubleshooting, or lack of awareness and can lead to security breaches if logs are accessible in production environments or accessed by unauthorized users. This practice increases the risk of unauthorized access, compliance violations, and data breaches, making it essential to review and sanitize all output statements before deployment.

Fix recommendation

Never log or print sensitive information such as passwords, tokens, API keys, credentials, credit card numbers, SSNs, or private keys.

Use generic, non-sensitive messages for logs and console output that describe events without exposing confidential data.

Mask or redact sensitive data if logging is unavoidable (example: hash passwords, truncate tokens, mask credit card numbers).

Regularly review code for unsafe output statements (console.log, console.debug, console.info, console.warn, console.error, logger calls) before deployment.

Implement secure logging practices: use structured logging, control log access, disable console output in production, and ensure logs are stored securely.

Use environment-specific logging configurations to prevent sensitive data from appearing in production logs.

[Go to Table of Contents](#)

M Injection - Exec code injection

Cause

Using exec can be dangerous as it allows a user to inject random python code, including malicious code. A user can build or inject a string that contains Python functions to potentially erase, expose credentials, or perform malicious actions. Packages such as ceilometer, cinder, neutron, and nova utils execute/trycmd functions can run malicious code.

```
exec(cmd)
ceilometer_utils.execute(cmd)
cinder_utils.execute(cmd)
neutron_utils.execute(cmd)
nova_utils.execute(cmd)
nova_utils.trycmd(cmd)
exec('def func(x): return {} * x**2 + {} * x + {}'.format(a, b, c))
    return func
exec('{} = {}'.format(name, 0))
```

Fix recommendation

To completely safeguard the application from Python code injection, do not use exec or malicious packages that use execute/trycmd functions.

External references

- [Exec code Injection](#)

M PathTraversal - Join and relpath path traversal

Cause

When using `os.join` or `os.repath`, path traversal is possible. Path traversal allows an attacker inappropriate access to a file.

```
def function():
    name = request.args.get('name')
    return send_file(os.path.relpath(os.getcwd(), name))
```

Fix recommendation

Do not to rely upon user input when dealing with file system access. If such a scenario is unavoidable, make sure the file is in an expected directory and the application throws an error if it is not. Alternatively, check the file name being requested by using a map and an ID in the request.

```
def verify_path(basedir, path):
    return os.path.realpath(path).startswith(basedir)

def function():
    name = request.args.get('name')
    if verify_path(os.getcwd(), name):
        return send_file(os.path.relpath(os.getcwd(), name))
    else:
        print("Throw an error")

files = {
    "1" : "/tmp/file1.txt",
    "2" : "/tmp/file2.txt",
    "3" : "/tmp/file3.txt"
}

def load_file(id):
    return open(files[id])
```

H PrivilegeEscalation - No non-root USER specified in Dockerfile configuration

Cause

When executing a Docker image, by default the user that runs the process is root. As a best practice, you should run with a user that does not have high privileges; this help prevent privilege escalation. Apple the Principle of Least Privilege (POLP) when building or running a Docker image: give your user only the privileges it needs to perform the intended functions.

```
FROM alpine:3.4

RUN apk update
RUN apk add vim
RUN apk add curl
```

Fix recommendation

To protect against privilege escalation, run with a user that only has enough privileges to perform the intended functions. You can use ROOT to configure your machine and install tools you need, mount driver, create new users and other function that require ROOT access. Then use the Docker USER command to define the user to run the image as. Use either: USER <user>[:<group>] or USER <UID>[:<GID>]

```
FROM alpine:3.4
<In this section you might need to run as ROOT to set up your machine. Install, mount, etc>
RUN groupadd -r myuser && useradd -r -g myuser myuser
RUN apk update
RUN apk add vim
RUN apk add curl
<Once you're done with the actions that need ROOT permissions, switch to your unprivileged user>
USER myuser
```

```
FROM selenium/node-chrome:4.0.0-beta-1-20210215
USER root

RUN apt-get update -qqy \
&& rm -rf /var/lib/apt/lists/* /var/cache/apt/* \
&& rm /bin/sh && ln -s /bin/bash /bin/sh \
&& chown seluser /usr/local

USER myuser
```

H Reflected Cross Site Scripting - JQuery HTML Function Use

Cause

Content being passed into the `html()` setter method should be checked for tainted data. Since this data is further used to insert text, HyperText Markup Language (HTML), and/or script inside of a page, steps should be taken towards validating this data.

Content inputted to the `html()` setter method should not be trusted without further validation. Using such content without validation can lead to a variety of Cross Site Scripting and HTML Injection attacks.

```
<script language="javascript">
...
var par = <%request.getParameter("param1")%>;
$('div1').html = par;
...
</script>
```

Fix recommendation

It is recommended that all `html()` setter methods be replaced with `text()` setter methods. These methods simply write the data as plain text to the browser without rendering HTML or script.

```
<script language="javascript">
...
$.post('ThirdPartyWebService.php', function(data){
  $('div1').text = data;
});
...
</script>
```

If the `html()` setter methods are necessary, further validation on the input is recommended.

Validation of such content when it is exposed to the user should be performed in the same manner as server-side input validation. Input validation should not be solely performed by client-side JavaScript components exposed to the user. Validation implemented in this manner can be bypassed by means of manipulating the browser and/or the submitted request. Use Server-Side validation or a combination of Client-Side and Server-Side validation.

Furthermore, any unnecessary content should not be passed to these methods.

```
<script language="javascript">
...
var par = <%request.getEncodedParameter("param1")%>;
$('div1').html = par;
...
</script>
```

Additionally, you can add JavaScript that performs whitelist validation on the input data:

```
<script language="javascript">
...
$.post('ThirdPartyWebService.php', function(data){
  if (inText.match(/^[a-zA-Z0-9]$/)) // Only allow alpha-numeric data
  {
    $('div1').html = data;
  }
});
...
</script>
```

H Reflected Cross Site Scripting - Insecure Use of Window Open

Cause

Content being passed into the `Window.Open()` method should be checked for containing tainted data. Since this data is further used to open a new browser and load a page into it, steps should be taken towards validating this data. Content inputted to the `Window.Open()` method should not be trusted without further validation. Using such content without validation can lead to a variety of Phishing, Cross Site Scripting, and HTML Injection attacks.

```
<script language="javascript">
...
var par = <%request.getParameter("param1")%>;
window.open(par);
...
</script>
```

Fix recommendation

In the cases where this method carries input originating from an external location, further validation on the input is recommended.

Validation of such content when it is exposed to the user should be performed in the same manner as server-side input validation. Input validation should not be solely performed by client-side JavaScript components exposed to the user. Validation implemented in this manner can be bypassed by means of manipulating the browser and/or the submitted request. Use Server-Side validation or a combination of Client-Side and Server-Side validation.

Furthermore, any unnecessary content should not be passed to this method.

```
<script language="javascript">
...
window.open("http://www.example.com");
...
</script>
```
